

Situation

Understanding Lyka's
context and AI ambitions

Lyka is looking to identify and leverage opportunities where AI and automation can improve operational efficiency across its core business operations teams.

Lyka is a leading Australian fresh pet food company with a complex operation supported by **People Operations, Business Operations, and Customer Care**. They have identified opportunities to raise capability and automate manual processes across these teams.

Source: Initial discussions with Lyka ELT Member (Mary Dong)

Lyka wants organisation-wide PO compliance and is mid implementation of a PO before invoice process in HQ.

Situation

Understanding Lyka's
PO compliance project

- **Lyka is rolling out Zudello to manage PO creation and invoice matching.**
 - Phase 1 live since mid-February for ops teams already using POs
 - Phase 2 targets May 2026 for all remaining departments, but inefficiencies in the new process are putting the timeline at risk
- **While temporary staff have cleared the backlog, the permanent team can still only match and pay 40 to 60 of the ~100 invoices received daily.**
 - Non ops teams are raising POs for the first time and making errors
 - Zudello isn't extracting all invoice details or auto-matching POs reliably
- **Without visibility into the end-to-end process and its performance, it's hard to diagnose bottlenecks or measure improvement.**
 - There's currently no central dashboard containing outstanding invoices, mismatches, or overdue payables, making it difficult to understand the issues and opportunities for improvement

Lyka would like to improve the purchase-to-pay process by getting a full issue understanding, process visibility, and improved PO compliance.

The team want to:

- 1 **Establish a live view of AP performance and issues:** Build dashboard(s) that help to track invoice matching performance, team level PO compliance, and any backlog so that it can be actively managed until clear
- 2 **Improve understanding of AP process issues and desired end state:** Through workshops, interviews, and analysis, map the current process to identify and prioritise key issues and bottlenecks. Set process performance targets so AP can scale activity and reduce the need for manual intervention through smarter system configuration and automation
- 3 **Improve PO process efficiency and invoice match rate:** Reduce the rate of POs with incorrect details, or raised retroactively, through targeted training, process improvement, and automation. This could include tuning Zudello performance to increase automatic match rate, while also looking at customisations alongside Zudello to improve data quality, flow, and throughput

Objectives

What the AP team would like to achieve with Turing Works

Lyka's recent consolidation of HR tooling into Rippling and planned investment in a dedicated People Ops Manager present a strong opportunity to build AI capability and generate operational leverage.

Our work will focus on two core areas to build capability in the People Team:

1. **AI Workshops and Capability Building:** We will equip the People Team to become AI natives of current tooling, and to become aware of use cases for future tooling. Through hands-on, problem-led workshop training, we will empower the team to discover and solve problems using AI themselves. Initial success will establish adoption of AI tools, while building out bottom up use cases for AI from the People team.
2. **AI Automations Assessment:** We will map the current People Ops tech stack and workflows against the latest AI capabilities. By auditing the existing tech stack and prioritising opportunities by impact and effort, we can deliver a roadmap and ROI benchmark for targeted automations of high-friction admin—such as letter generation, document reminders, anniversary gifts, visa expiry tracking, and more.

Objectives

How Turing Works will
help Lyka unlock AI
capability
